`melting` *melting*

Description

R interface to the MELTING 5 software (Le Novère, 2001; Dumousseau et al., 2012) for computation of enthalpy and entropy of the helix-coil transition, and then the melting temperature of a nucleic acid duplex.

Arguments

sequence	Sequence (5' to 3') of one strand of the nucleic acid duplex as a character string.
comp.sequence	Complementary sequence (3' to 5') of the nucleic acid duplex as a character string.
nucleic.acid.conc	Concentration of the nucleic acid strand (mol L^{-1}) in excess as a numeric value.
hybridisation.type	The hybridisation type. Either "dnadna", "rnarna", "dnarna", "rnadna", "mrnarna" or "rnamrna" (see **Hybridisation type options**).
Na.conc	Concentration of Na ions (M) as a numeric value (see **Ion and agent concentrations**).
Mg.conc	Concentration of Mg ions (M) as a numeric value (see **Ion and agent concentrations**).

`Tris.conc` Concentration of Tris ions (M) as a numeric value (see **Ion and agent concentrations**).

`K.conc` Concentration of K ions (M) as a numeric value (see **Ion and agent concentrations**).

`dNTP.conc` Concentration of dNTP (M) as a numeric value (see **Ion and agent concentrations**).

`DMSO.conc` Concentration of DMSO (%) as a numeric value (see **Ion and agent concentrations**).

`formamide.conc` Concentration of formamide (M or % depending on correction method) as a numeric value (see **Ion and agent concentrations**).

`size.threshold` Sequence length threshold to decide approximative or nearest-neighbour approach for computation. Default is 60.

`self` logical. Specifies that `sequence` is self complementary and `complementary sequence` is not required (seed **Self complementary sequences**). Default is `FALSE`.

`correction.factor`
Correction factor to be used to modulate the effect of the nucleic acid concentration (`nucleic.acid.conc`) in the computation of melting temperature (see **Correction factor for nucleic acid concentration**).

`method.approx` Specify the approximative formula to be used for melting temperature calculation for sequences of length greater than `size.threshold`. Either `"ahs01"`, `"che93"`, `"che93corr"`, `"schdot"`, `"owe69"`, `"san98"`, `"wetdna91"`, `"wetrna91"` or `"wetdnarna91"` (see **Approximative formulas**).

`method.nn` Specify the nearest neighbor model to be used for melting temperature calculation for sequences of length lesser than `size.threshold`. Either `"all97"`, `"bre86"`, `"san04"`, `"san96"`, `"sug96"`, `"tan04"`, `"fre86"`, `"xia98"`, `"sug95"` or `"tur06"` (see **Nearest neighbor models**).

`method.GU` Specify the nearest neighbor model to compute the contribution of GU base pairs to the thermodynamic of helix-coil transition. Available method is `"tur99"` (see **GU wobble base pairs effect**).

`method.singleMM`
Specify the nearest neighbor model to compute the contribution of single mismatch to the thermodynamic of helix-coil transition. Either `"allsanpey"`, `"tur06"`, `"zno07"` or `"zno08"` (see **Single mismatch effect**).

`method.tandemMM`
Specify the nearest neighbor model to compute the contribution of tandem mismatches to the thermodynamic of helix-coil transition. Either `"allsanpey"` or `"tur99"` (see **Tandem mismatches effect**).

`method.single.dangle`
Specify the nearest neighbor model to compute the contribution of single dangling end to the thermodynamic of helix-coil transition. Either `"bom00"`, `"sugdna02"`, `"sugrna02"` or `"ser08"` (see **Single dangling end effect**).

`method.double.dangle`
Specify the nearest neighbor model to compute the contribution of double dangling end to the thermodynamic of helix-coil transition. Either `"sugdna02"`, `"sugrna02"`, `"ser05"` or `"ser06"` (see **Double dangling end effect**).

`method.long.dangle`
Specify the nearest neighbor model to compute the contribution of long dangling end to the thermodynamic of helix-coil transition. Either `"sugdna02"` or `"sugrna02"` (see **Long dangling end effect**).

`method.internal.loop`
: Specify the nearest neighbor model to compute the contribution of internal loop to the thermodynamic of helix-coil transition. Either `"san04"`, `"tur06"` or `"zno07"` (see **Internal loop effect**).

`method.single.bulge.loop`
: Specify the nearest neighbor model to compute the contribution of single bulge loop to the thermodynamic of helix-coil transition. Either `"san04"`, `"tan04"`, `"ser07"` or `"tur06"` (see **Single bulge loop effect**).

`method.long.bulge.loop`
: Specify the nearest neighbor model to compute the contribution of long bulge loop to the thermodynamic of helix-coil transition. Either `"san04"` or `"tur06"` (see **Long bulge loop effect**).

`method.CNG`
: Specify the nearest neighbor model to compute the contribution of CNG repeats to the thermodynamic of helix-coil transition. Available method is `"bro05"` (see **CNG repeats effect**).

`method.inosine`
: Specify the pecific nearest neighbor model to compute the contribution of inosine bases (I) to the thermodynamic of helix-coil transition. Either `"san05"` or `"zno07"` (see **Inosine bases effect**).

`method.hydroxyadenine`
: Specify the nearest neighbor model to compute the contribution of hydroxyadenine bases (A*) to the thermodynamic of helix-coil transition. Available method is `"sug01"` (see **Hydroxyadenine bases effect**).

`method.azobenzenes`
: Specify the nearest neighbor model to compute the contribution of azobenzenes (X_T for trans azobenzenes and X_C for cis azobenzenes) to the thermodynamic of helix-coil transition. Available method is `"asa05"` (see **Azobenzenes effect**).

`method.locked`
: Specify the nearest neighbor model to compute the contribution of locked nucleic acids (AL, GL, TL and CL) to the thermodynamic of helix-coil transition. Available method is `"mct04"` (see **Locked nucleic acids effect**).

`correction.Na`
: Specify the correction method for Na ions. Either `"ahs01"`, `"kam71"`, `"owc1904"`, `"owc2004"`, `"owc2104"`, `"owc2204"`, `"san96"`, `"san04"`, `"schlif"`, `"tanna06"`, `"wetdna91"`, `"tanna07"`, `"wetrna91"` or `"wetdnarna91"` (see **Sodium corrections**).

`correction.Mg`
: Specify the correction method for Mg ions. Either `"owcmg08"`, `"tanmg06"` or `"tanmg07"` (see **Magnesium corrections**).

`correction.NaMg`
: Specify the correction method for mixed Na and Mg ions. Either `"owcmix08"`, `"tanmix07"` or `"tanmix07"` (see **Mixed Sodium and Magnesium corrections**).

`method.Naeq`
: Specify the ion correction which gives a sodium equivalent concentration if other cations are present. Either `"ahs01"`, `"mit96"` or `"pey00"` (see **Sodium equivalent concentration methods**).

`correction.DMSO`
: Specify the correction method for DMSO. Specify the correction method for DMSO. Either `"ahs01"`, `"mus81"`, `"cul76"` or `"esc80"` (see **DMSO corrections**).

`correction.formamide`
: Specify the correction method for formamide. Specify the correction method for formamide Either `"bla96"` or `"lincorr"` (see **Formamide corrections**).

Mandatory arguments

The following are the arguments which are mandatory for computation.

- `sequence`
- `comp.sequence`: Mandatory if there are mismatches, inosine(s) or hydroxyadenine(s) between the two strands. If not specified, it is computed as the complement of `sequence`. Self-complementarity in `sequence` is detected even though there may be (are) dangling end(s) and `comp.sequence` is computed (see **Self complementary sequences**).
- `nucleic.acid.conc`
- `Na.conc, Mg.conc, Tris.conc, K.conc`: At least one cation (Na, Mg, Tris, K) concentration is mandatory, the other agents(dNTP, DMSO, formamide) are optional.
- `hybridisation.type`

Hybridisation type options

The details of the possible options for hybridisation type specified in the argument `hybridisation.type` are as follows:

Option	`Sequence`	`Complementary sequence`
`dnadna`	DNA	DNA
`rnarna`	RNA	RNA
`dnarna`	DNA	RNA
`rnadna`	RNA	DNA
`mrnarna`	2-o-methyl RNA	RNA
`rnamrna`	RNA	2-o-methyl RNA

This parameter determines the nature of the sequences in the arguments `sequence` and `comp.sequence`.

Ion and agent concentrations

These values are used for different correction functions which approximately adjusts for effects of these ions(Na, Mg, Tris, K) and/or agents(dNTP, DMSO, formamide) on on thermodynamic stability of nucleic acid duplexes. Their concentration limits depends on the correction method used. All the concentrations must be in M, except for the DMSO (%) and formamide (% or M depending on the correction method). Note that Tris+ concentration is about half of the total tris buffer concentration.

Self complementary sequences

Self complementarity for perfect matching sequences or sequences with dangling ends is detected automatically. However it can be specified by the argument `self`.

Correction factor for nucleic acid concentration

For self complementary sequences (Auto detected or specified in `self`) it is 1. Otherwise it is 4 if the both strands are present in equivalent amount and 1 if one strand is in excess.

Approximative estimation formulas

The calculation is increasingly incorrect when the length of the duplex decreases. Moreover, it does not take into account nucleic acid concentration.
